Accenture - Wheebox

1. Two ships are sailing in the sea on the two sides of a lighthouse. The angle of elevation of the top of the lighthouse is observed from the ships are 30° and 45° respectively. If the lighthouse is 100 m high, the distance between the two ships is:
a. 173 m b. 200 m c. 273 m d. 300 m
Answer: C

2. A man standing at a point P is watching the top of a tower, which makes an angle of elevation of 30° with the man's eye. The man walks some distance towards the tower to watch its top and the angle of the elevation becomes 60°. What is the distance between the base of the tower and the point P?
a. 60 units b. 8 units c. 12 units
Answer: D

3. The angle of elevation of a ladder leaning against a wall is 60° and the foot of the ladder is 4.6 m away from the wall. The length of the ladder is:
a. 2.3 m b. 4.6 m c. 7.8 m d. 9.2 m
Answer: D

4. An observer 1.6 m tall is 2003 away from a tower. The angle of elevation from his eye to the top of the tower is 30°. The height of the tower is:
a. 21.6 m b. 32.3 m c. 24.72 m d. None of these
Answer: A

5. From a point P on a level ground, the angle of elevation of the top of the tower is 30°. If the tower is 100 m high, the distance of point P from the foot of the tower is:
a. 149 m b. 156 m c. 173 m d. 200 m
Answer: C

6. A man mixes 10 litres of alcohol with 40 litres of water. After selling one-fourth of this mixture, he adds alcohol to replenish the quantity that he has sold. What is the current proportion of alcohol to water?
a. 1:2 b. 3:2 c. 4:5 d. 2:3
Answer: D

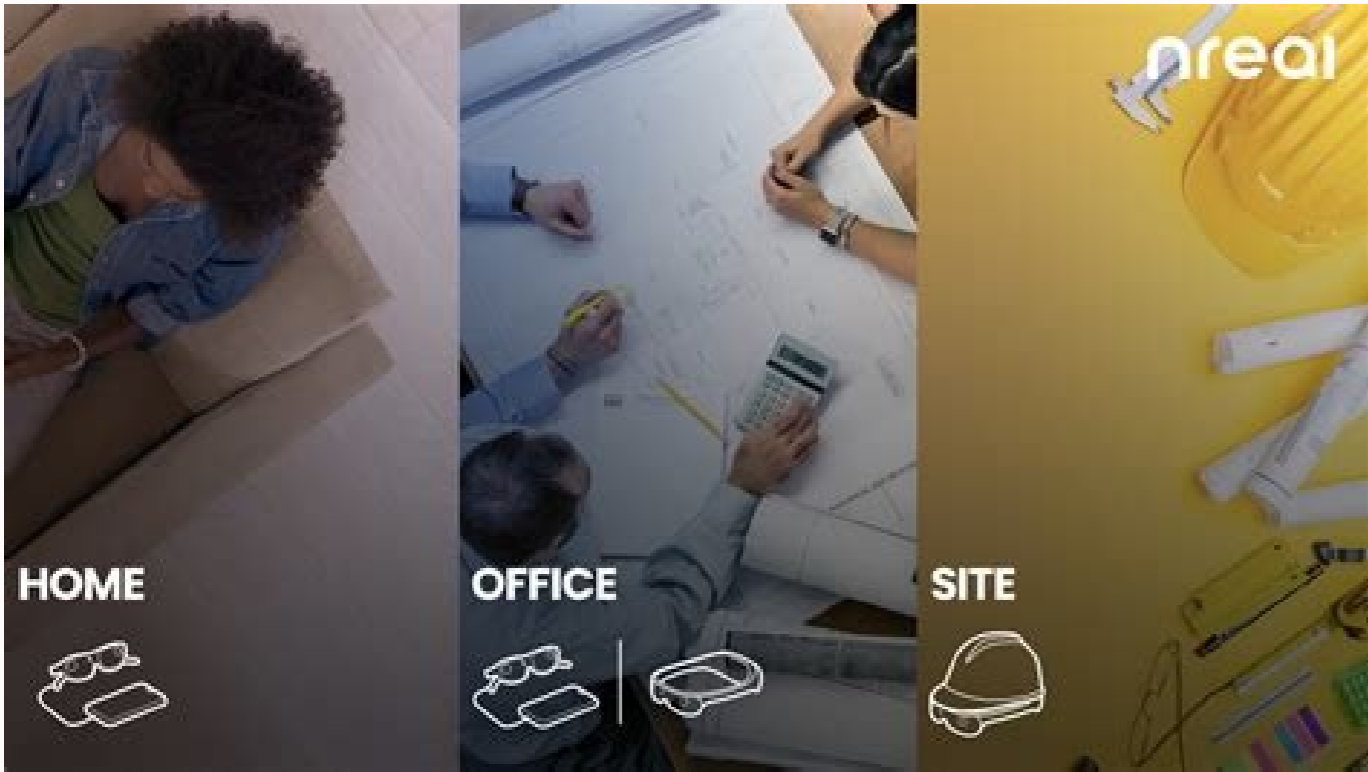

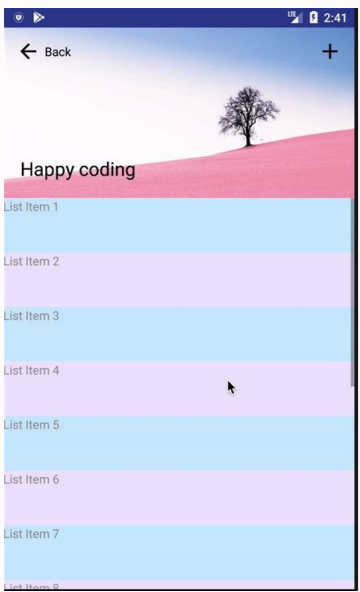

7. Lifestyle shopkeeper allows a discount of 50% for a formal shirt but still gains 20%. Find the marked price (in Rs.) of that shirt which cost him Rs. 10,000.
a. Rs. 20000 b. Rs. 25000 c. Rs. 20000 d. Rs. 18000
Answer: A

8. In two milkshakes, the ratio of chocolate sauce to milk is in the ratio 2:5 and 3:4. If 4 litres of the first milkshake and 6 litres of the second milkshake are mixed together to form a new milkshake, then what will be the ratio of chocolate sauce to milk in the new milkshake?
a. 1:122 b. 13:22 c. 1:1 d. 1:65
Answer: B

9. A man bought a certain number of pens and sold them at a gain of 20%. Had he sold them at a loss of 10%, he would have lost Rs. 1 when compared to the selling price for a gain of 20%. Which of the following statements is true?
a. The cost price is Rs. 50.
b. The selling price is Rs. 50.
c. The profit is Rs. 50.
d. The cost price depends on the value of x.
Answer: A

10. P, Q, and R enter into a partnership in the ratio 1:3:3. After 2 months, P increases his share by 40%. If the total profit at the end of one year be Rs. 1900, then P's share in the profit of Rs. is:
a. 350 b. 380 c. 400 d. 450
Answer: C

11. Ellen is planning a special birthday dinner for her husband's 30th birthday. She wants the evening to be memorable, but her husband is a simple man who would rather be in jeans at a baseball game than in a suit at a fancy restaurant. Which restaurant below should Ellen choose?
a. Alfredo's offers fine Italian cuisine and an elegant Tuscan decor. Patrons will feel as though they've spent the evening in a luxurious Italian villa.
b. Pancho's Mexican Buffet is an all-you-can-eat family style smorgasbord with the best faces in town.

The file exports an object with keys corresponding to image locations and the corresponding static require() statement. You can refer to the `/src/dataService/dataService.disconnected.js` file for implementation details. When working in connected or connected tunnel mode, you can use the `/assets/images.connected.js` map, removing references to images retrieved through HTTP requests. Page 2 Abstract Describes limitations for macOS when working with JSS for React Native. When working with JSS for React Native, you might encounter the following limitations: For macOS, the `ttab` dependency does not work in VS Code PowerShell terminal. For macOS, the `glob` pattern `/Sitecore/*/*`. Sitecore.js used by all other demo apps does not work for finding `sitecore.js` files for Sitecore manifest generation. For macOS, Sitecore.Ship might throw an error on manifest package deployment. Abstract Overview of how JSS React Native handles assets. JSS React Native application can have two types of assets: Static assets that are embedded as resources in the application. Network assets that are retrieved from remote URLs. When developing in disconnected mode, we suggest you treat future network assets as static assets. For instance, if you are following a code-first approach, you will likely have assets in your codebase that you will eventually import into Sitecore. Inside the `package.json` we simply create a name for our new module. The primary aim of refactoring is to impose order, not chaos. Additionally, if the need arises to reuse an asset for a second or third component one of two things becomes necessary. The asset path must be static, meaning you can not use dynamic values for paths passed to the `require()` function. For example, the disconnected data provided in the `/data/routes/en.json` file contains an image field referencing the `/data/media/img/sc logo.png` image file. You can map static asset paths to `require()` statements in the `/assets/images.disconnected.js` file. However, you might want to test your app with all assets handled as static assets before that. In React Native, static assets must be referenced in your code with a `require()` statement so that the React Native packager can resolve references to assets at build time and include them in your app bundle. Since the only relative paths we are using are now within the dictionary, they are likely to never change. When retrieving disconnected route data, the application processes the data and replaces any static image paths it encounters with the corresponding value from the map mentioned previously. It's a slightly contrived example but you get the idea. `app --assets --img --menu-icon@1x.ios.png --menu-icon@1x.android.png --profile-icon@1x.ios.png --profile-icon@1x.android.png --settings-icon@1x.ios.png --settings-icon@1x.android.png --images.js --package.json --components --nav --menu.js` Inside the `images.js` file, we can simply maintain a dictionary object that houses a single reference to the asset path. `const images = { menuIcon: require('./img/menu-icon.png'), profileIcon: require('./img/profile-icon.png'), settingsIcon: require('./img/settings-icon.png') };` export default images; All that's needed now is to expose a reference to our image dictionary to the rest of the app. At that point, the image components are slightly easier to read and removing all local image folders into an assets directory cleans up any component directories. Happy refactoring! Either that, or the relative path to the asset must be updated, but this second option adds a bit of randomness in the file structure. As you begin to move components around and add nested structures to the app, the static assets now must travel along with its component since they are being served from a sister directory. Either a duplicate of the asset must be maintained along with the new component, or again, a seemingly random relative path has to be maintained as a reference to an asset that lives in a completely different directory somewhere in the file structure. `{ "name": "@assets" }` Now, wherever we need to use an asset we can import the image dictionary as a module and simply access any key we desire as the image source. `import Images from '@assets/images';` The wins here for code maintenance are substantial. When the React Native Image component needs to reference that image statically, it must be required with `require('./data/media/img/sc logo.png')`, a statement that cannot execute at runtime. To work around this limitation, you must map static assets in disconnected mode and then swap out references to those assets at runtime. React Native Packager ships with some niceties for managing static images and the docs do a decent job of getting things started for small scale applications. However, as projects scale, nested hierarchies develop and refactoring becomes necessary to maintain a clean code base. This is what an image component would look like when sourcing the correct image from within the `menu.js` file. Packager will simply follow the relative path into the `img` folder and select the image that is both appropriate for the platform (iOS or Android) and the correct pixel density for the device that's running the app. Consider that same feature but this time with a separately maintained assets directory and a slightly more nested structure. This is achieved by adding a `package.json` file to the folder that we wish to export. When that time comes, having local assets required in via relative paths becomes a bit of a chore to keep up with. Consider the following basic application structure for a simple menu component and its accompanying static image assets: `app --components --img --menu-icon@1x.ios.png --menu-icon@1x.android.png --profile-icon@1x.ios.png --profile-icon@1x.android.png --settings-icon@1x.ios.png --settings-icon@1x.android.png --menu.js --menuStyles.js` As suggested in the React Native docs, static assets can be imported directly into the source attribute of the Image component. Even if they did, say in the case of adding nested hierarchies to the images folder, only a single update would need to be made in the dictionary and this change would ripple across wherever that asset is imported. None of these are very appealing options. Fortunately, there is a better way to manage static assets with something akin to an absolute path. This pattern will pass muster in the early stages of the project, but can be tedious to maintain as the application scales for a couple reasons. First, as applications grow it's often handy to organize components into subdirectories grouped either by feature or by type.

Or, include this PR manually for v7+ stability on android for older RN (included in 0.57-stable and newer). The latest version of v6, v7, v8 and v9 should all work in the latest react-native version. v7 and newer requires the patch for making android thread safe, to get native animation support. React Native also exposes JavaScript interfaces for platform APIs, so your React Native apps can access platform features like the phone camera, or the user's location. React Native currently supports both iOS and Android and has the potential to expand to future platforms as well. In this tutorial, we'll cover translation and text to ... 19/11/2021 · However, React Native beats Flutter in this ability since it shares code with web apps and via creating abstraction elements. So, by choosing it, you will kill not two but three birds with one stone, in fact. Yet, React Native isn't self-sufficient to support such endeavors. You will have to rely on third-party libraries (React Native for Web ... 03/04/2021 · Release APK. Step 1. Generate a keystore. You will need a java generated signing key which is a keystore file used to generate a React Native executable binary for Android. For Android, you need to create assets folder in path `android/app/src/main/assets/fonts` like below: If you are using React-native
